1. Incident Summary:

On April 1, 2026, at 15:00 IST, a high-severity remote root compromise was identified on the Metasploitable 2 server 10.0.2.3. The attack utilized the usermap_script vulnerability in Samba 3.0.20. Detection was confirmed via agentless syslog telemetry, and the threat was successfully contained via IP-layer isolation using CrowdSec within 10 minutes.

2. Timeline:

Timestamp	Event	Source
15:00:00	Initial Exploitation (Metasploit)	Kali linux
15:02:15	UDP 514 syslog packets received	Wazuh Manager
15:05:00	Manual Triage initiated (TheHive Outage)	Himansh Purswani (SOC Analyst)
15:10:00	Attacker IP Null-Routed (LAPI Block)	CrowdSec
15:12:00	Connectivity ping test	Containment Veirfied

3. Root Cause Analysis (5 Whys):

- **Why was the breach successful?** An unpatched Samba service was exploited.
- **Why was it unpatched?** The asset is a legacy Metasploitable 2 VM.
- **Why was it on the network?** Retained for legacy application support.
- **Why was detection delayed?** Java-based SIEM components (TheHive/Cassandra) suffered resource exhaustion.
- **Why resource exhaustion?** Insufficient RAM (under 12GB) for the full security stack.

4. Recommendations:

Immediate: Decommission the Metasploitable 2 instance.

Short-term: Implement a "Default Deny" firewall policy for SMB ports 139/445.

Long-term: Increase SOC infrastructure RAM to 16GB to ensure SIEM stability during high-telemetry incidents.

150 Words stakeholder summary:
Today, I identified and neutralized a critical intrusion attempt targeting a file server. The attacker exploited a known Samba vulnerability to gain unauthorized access.
Although our primary reporting dashboard experienced a temporary service delay due to high system load, after having to deal with that I successfully pivoted to manual network monitoring to confirm the breach. We utilized the CrowdSec security engine to immediately isolate the attacker's IP address, ensuring no sensitive data was exfiltrated.

Key Metrics:

- **Mean Time to Detect:** 2 Minutes
- **Mean Time to Respond:** 8 Minutes

The threat is 100% contained. Moving forward, I am retiring this legacy server and upgrading the monitoring infrastructure to prevent future resource-related gaps. No further action is required this time.
