Remote code execution incident resolved:

Briefing non-technical manager (100 words)

Earlier today, the monitoring system wazuh detected a high-priority cyberattack targeting the metasploitable instance. A vulnerability in an older software service allowed an unauthorized user to gain control of the system. I responded within five minutes, successfully blocking the attacker's connection and isolating the server from the rest of the network. I have verified through the central logs that no sensitive information was stolen. I am now performing a deep-clean of the system and will be replacing this older server with a more secure version to prevent future risks.
