Incident escalation practice:

Escalation to tier 2 Summary (100 words):

At 13:00 on 2026-03-25, a high priority alert triggered for unauthorized access on Server -Y. Initial triage identified the source IP as 192.168.1.200, which was successfully authenticated using valid but suspicious credentials MITRE T1078. Analysis showed that there were no previous communications with this IP. I had initially isolated the server to prevent lateral movement. Requesting tier 2 investigation to determine the extent of credential compromise and identify if any data exfiltration.
