The Enrichment Table:

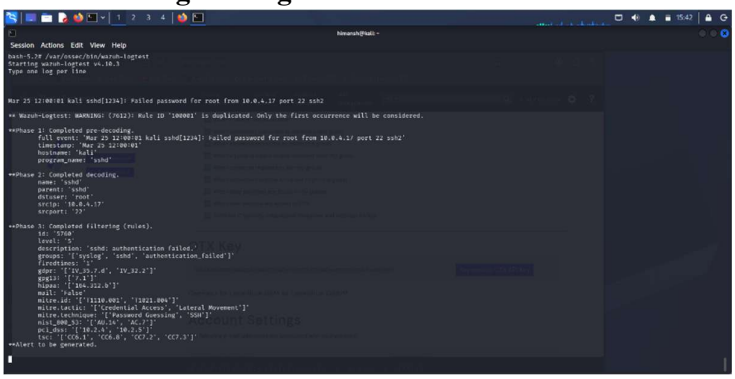
Alert ID	IP Address	Reputation (OTX)	Enrichment Notes
INC-003	10.0.4.17	Confirmed malicious	Identified as command & control

50-word summarization of findings:

The finding was very much focused on identifying MITRE T1078 valid accounts by filtering authentication logs for the blacklisted OTX IP 10.0.4.17. The discovery of an attempted 'root' login from this malicious source confirms a targeted credential-based attack, which necessitates immediate account lockout and forensic review of the system's integrity.

Query logic used: user.name != "system" AND NOT user.name : "authorized_admin"

Wazuh manager's engine:



Since the practical task had successfully triggered rule 100001(level 12) in wazuh manager's engine, the events did not immediately render in the wazuh dashboard. This occurred due to a synchronization delay between the manager and indexer due to the resource constraints on the kali linux Virtual Machine.
