Escalation to tier 2: via The Hive (100-word Summary)

Case ID: SAMBA-001

At 13:21, a high severity remote code execution alert was triggered on the metasploitable2 instance. Tirage done via the Wazuh Discover tab confirmed that the attacker at 10.0.2.15 exploited the usermap_script vulnerability to obtain a interactive root shell. I initiated immediate containment by deploying a CrowdSec IP ban on the source, successfully isolating the target and stopping the live session. I am escalating this to tier 2 for forensic analysis to check for lateral movement, data exfiltration or if any backdoors were installed during the attack.
